Assume the following sketch was created (straight line, arc and spline); all tangent.

To copy (offset) the curve, three offsets must be done if the offset is normal to the Frontal plane.
Showing the offset of the arc:

After offsetting the straight line:
To collect curves to make the composite copy, select the end curve (straight line) until it is dark red;

Hold the shift key down and select the dark red curve again (usually near the tangent end), then shift select the other two curves (arc and spline).
You can now use Edit-Copy and Edit-Paste to generate the composite curve.

You now have three offset curves and one composite curve overlaying each other.
